

Application for Establishing the International Training Center of Temporomandibular Joint Surgery (Shanghai, China)

To the German Surgical Foundation,

Regis Company has been deeply engaged in the diagnosis and treatment of temporomandibular joint diseases for more than ten years, focusing on four core areas: technological research and development, instrument innovation, clinical diagnosis and treatment, and professional personnel training. We have accumulated mature industry operation experience, built a sound international reputation, and established a professional benchmark in the global field of temporomandibular joint surgery. To build a global, standardized and high-level training platform for temporomandibular joint surgery, break regional technical barriers, and promote the high-quality coordinated development of global oral surgery, we hereby formally apply to your Foundation to take the lead in establishing the International Training Center for Temporomandibular Joint Surgery (Shanghai, China) in Shanghai, and sincerely request your Foundation to review this application. At present, temporomandibular joint disease has become a highly prevalent oral and maxillofacial disease worldwide, with a continuously rising incidence rate and growing global demand for diagnosis and treatment. However, the industry still faces many bottlenecks: high-quality medical resources are extremely unevenly distributed globally, and the diagnosis and treatment capabilities of

physicians in developing countries vary widely; a standardized training system is lacking, leading to insufficient mastery of cutting-edge technologies and weak practical skills among primary physicians; the international technical exchange and cooperation mechanism is imperfect, and the popularization of advanced diagnosis and treatment technologies is slow. These problems have seriously restricted the overall improvement of the global temporomandibular joint surgery industry.

Against this background, establishing an international training platform with unified standards, efficient connectivity and global coverage to solve the pain points of industry development has become an urgent and important task. After years of careful construction and accumulation, our company has fully met the conditions for establishing the International Training Center for Temporomandibular Joint Surgery, and can ensure the high-standard construction and standardized operation of the center.

The details are as follows:

1. Complete Hardware Facilities to Ensure Standardized Training Our company has built a 500-square-meter professional surgical training center in the core area of Shanghai, equipped with 10 sets of high-definition 4K endoscopes, high-precision surgical training head models and a full set of temporomandibular joint surgery instruments, which can meet the large-scale and standardized practical training needs of trainees. Meanwhile, a 100-square-meter standardized theoretical

teaching center has been constructed, equipped with advanced online-offline synchronous live teaching equipment, enabling trainees from multiple countries and regions to participate in training simultaneously, breaking geographical restrictions and expanding training coverage.

2. Outstanding International Training Achievements and Mature Training Experience Since 2005, our company has undertaken training

programs for international counterparts visiting China. By the end of 2025, we have received a total of 103 international physicians to learn core techniques such as temporomandibular joint arthroscopy and artificial joint replacement surgery. Trainees are from Europe, Asia, Africa and other regions, and the number of trainees has been growing steadily year by year. In 2025 alone, 25 international physicians were trained. In the first quarter of 2026, we have successfully completed specialized training for 2 international physicians from Thailand and Malaysia. The training effect has been highly recognized by the trainees and their medical institutions, laying a solid foundation for the regular operation of the training center.

3. Solid Foundation in Technology and International Exchanges, Strong Resource Docking Capabilities Our company has a teaching team

composed of senior domestic and international experts in temporomandibular joint surgery, with core members possessing rich clinical diagnosis and treatment and teaching experience. Relevant diagnosis and treatment instruments have obtained 5 international patents, and our technical level is at the forefront of the global industry. Meanwhile, our company has successfully hosted many international academic conferences on temporomandibular joint surgery, and established stable cooperation mechanisms with authoritative experts and medical institutions in Germany, Thailand, Malaysia and other countries, with the ability to efficiently connect high-quality international resources and build bridges for international exchanges.

To ensure the standardized, efficient and sustainable operation of the International Training Center for Temporomandibular Joint Surgery (Shanghai, China) and give full play to the core value of the training platform, our company has formulated a comprehensive operation plan as

follows: First, build a standardized training system. In accordance with global standards for temporomandibular joint surgery diagnosis and treatment, we will design hierarchical and categorized training courses covering three core modules: theoretical teaching, practical training and clinical preceptorship. Authoritative experts from home and abroad will be invited to give lectures to ensure that the training content meets actual clinical needs, guarantee training quality, and cultivate standardized physicians with professional literacy and practical capabilities for the world. Second, continuously optimize hardware and service capabilities. According to training needs, we will constantly upgrade the hardware facilities of the surgical training center and theoretical teaching center, expand online training channels, optimize online teaching experience, expand training coverage, and improve the convenience and professionalism of training services to meet the training needs of trainees from different countries and at different levels. Third, deepen international exchanges and cooperation. We will regularly hold international academic seminars, faculty exchanges, public welfare training and other activities to promote the exchange and integration of global temporomandibular joint surgery technologies. We will actively connect with relevant medical institutions and industry associations worldwide to build a cooperation platform for technology sharing and talent exchange, and support the coordinated development of the global

industry. Fourth, improve the operation and management system. We will establish sound systems for training management, faculty management, equipment management, safety management, etc., to standardize training processes and operation links. We will regularly report the work progress, training achievements and operation status of the training center to your Foundation, and take the initiative to accept your supervision and guidance to ensure the standardized and orderly operation of the training center. At present, the global temporomandibular joint surgery industry is facing sound development opportunities. Our company will seize this opportunity, actively cooperate with the 7th Asia-Europe Meeting to be held in Thailand in June 2026 and the proposed International Association of Temporomandibular Joint Surgeons, accelerate the implementation and operation of the training center, and contribute to the promotion and popularization of cutting-edge technologies in global temporomandibular joint surgery. The establishment of the International Training Center for Temporomandibular Joint Surgery (Shanghai, China) will not only effectively make up for the shortcomings of standardized training in global temporomandibular joint surgery, promote the balanced distribution of high-quality medical resources and improve the diagnosis and treatment capabilities of physicians worldwide, but also further expand the influence of your Foundation in the Asia-Pacific region and even the world, deepen medical and technical cooperation between China,

Germany and the world, achieve win-win results between your Foundation and our company, and jointly contribute to the development of the global temporomandibular joint surgery cause. We earnestly request your Foundation to carefully review and approve this application. Our company will strictly fulfill all commitments, construct and operate the training center with high standards and strict requirements, adhere to the original aspiration of training, improve training quality, and live up to the trust and support of your Foundation.
